If NO period for reply is specified above, the maximum statutory period will apply and will expire 6 MONTHS from the mailing date of this communication.

Office Action Summary

Application No.

09/772,658

Applicant(s)

CHIZAWA, NORIYOSHI

Examiner

James A. Thompson

Art Unit

2625

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 February 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-3,5-17,19-27 and 86 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-3,5-17,19-27 and 86 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 30 January 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DOUGLAS Q. TRAN
PRIMARY EXAMINER

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

- 6) ☐ Other: _____

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 27 February 2007 has been entered.

Response to Arguments

2. Applicant's arguments, see pages 9-11, filed 27 February 2007, with respect to the rejection of claims 1 and 15 under 35 USC §103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, new grounds of rejection is made in view of newly discovered prior art. Accordingly, new prior art rejections are set forth in detail below. Examiner notes that the limitations added into claims 1 and 15 by the present amendments are taken from previously recited claims 4 and 18, which are now canceled. The previously applied combination of Orito (US Patent 6,072,912) in view of Arimoto (US patent 5,371,613), Sugiura (US Patent 4,679,074), and Kamisuwa (US Patent 6,728,008 B1) applied to claims 4 and 18 is withdrawn and new prior art rejections set forth in detail below for present claims 1 and 15.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. **Claims 1, 3, 5, 8, 15, 17, 19, 21 and 86 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orito (US Patent 6,072,912) in view of Yamashita (US Patent 5,701,505) and Sugiura (US Patent 4,679,074).**

Regarding claims 1, 15 and 86: Orito discloses an image sensing system (figure 1(1) of Orito) constituted by connecting an image sensing apparatus (figure 1(30) of Orito) and image processing

Art Unit: 2625

apparatus (figure 1(10) of Orito) (column 5, lines 4-7 of Orito). Figure 2 of Orito shows further details of said image processing apparatus (column 4, lines 45-46 of Orito). Figure 5 of Orito shows further details of said image sensing apparatus (column 4, lines 50-52 of Orito).

Orito further discloses that said image sensing apparatus comprises a storage medium (figure 5 (73) of Orito) adapted to hold data on image sensing characteristic (column 6, lines 29-34 of Orito); and an output unit (figure 5(77) of Orito) adapted to output the data on image sensing characteristic held in said storage medium to said image processing apparatus (column 6, lines 6-14 of Orito).

Orito further discloses that said image processing apparatus comprises an input unit (figure 2(24) of Orito) adapted to receive the data on image sensing characteristic output from said image sensing apparatus (column 6, line 66 to column 7, line 6 of Orito); a generation unit (figure 2(17(portion)) of Orito) adapted to generate image sensing characteristic correction data (column 8, lines 41-45 of Orito) on the basis of the data on image sensing characteristic received by said input unit (column 8, lines 48-53 of Orito); and an image sensing characteristic correction unit (figure 2(17(portion)) of Orito) adapted to correct the influence of an image sensing characteristic on the image data received from said image sensing apparatus (column 8, lines 41-45 of Orito) using the image sensing characteristic correction data generated by said generation unit (column 8, lines 48-53 of Orito). Correcting an image sensing characteristic of image data received from said image sensing apparatus (column 8, lines 41-45 of Orito) inherently requires the generation in some form of said image sensing characteristic correction data in order to perform said correction. The control unit (figure 5(70) of Orito) comprises a CPU (figure 5(71) of Orito), a ROM (figure 5(72) of Orito), and a RAM (figure 5(73) of Orito) (column 6, lines 1-4 of Orito). Said generation unit and said image sensing characteristic correction unit correspond to the associated portion of the physically embodied software stored in said ROM, along with the RAM needed by the CPU to execute said program software, that is used to perform the functions of said generation unit and said image sensing characteristic correction unit.

Orito does not disclose expressly that said image sensing apparatus comprises an image sensing unit adapted to sense an original and output image data of the original, wherein said image sensing unit includes an image sensor which has a plurality of photoelectric conversion element arrays for respectively photoelectrically converting light of a plurality of colors; and a shading correction unit adapted to apply shading correction to the image data output from said image sensing unit. Orito further does not disclose expressly that said storage medium of said image sensing apparatus is adapted to hold data on an image sensing characteristic which is different from data for the shading correction.

Orito further does not disclose expressly that said image sensing characteristic correction unit of said image processing apparatus corrects the influence of an image sensing characteristic on the shading-corrected image data, and thus performs correction different than shading correction; and that said image sensing characteristic indicates spatial positional deviations of a plurality of colors of pixel signals, obtained by said plurality of photoelectric conversion element arrays of said image sensor, with respect to one of said pixel signals obtained by one of said plurality of photoelectric conversion element arrays.

Yamashita discloses an image sensing unit (figure 3(231) of Yamashita) adapted to sense an original and output image data of the original (column 6, lines 33-41 of Yamashita), wherein said image sensing unit includes an image sensor which has a plurality of photoelectric conversion element arrays (CCD) for respectively photoelectrically converting light of a plurality of colors (column 6, lines 21-36 of Yamashita); a shading correction unit (figure 11(363) of Yamashita) adapted to apply shading correction to the image data output from said image sensing unit (column 9, lines 63-66 of Yamashita); and an image sensing characteristic which indicates spatial positional deviations of a plurality of colors of pixel signals, obtained by said plurality of photoelectric conversion element arrays of said image sensor, with respect to one of said pixel signals obtained by one of said plurality of photoelectric conversion element arrays (figure 11(361); and column 9, lines 22-29 and lines 43-49 of Yamashita).

Orito and Yamashita are combinable because they are from the same field of endeavor, namely correction of scanned input digital image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to apply CCD color gap correction and shading correction for digital input image data. The motivation for doing so would have been to better correct for common artifacts in digital image data scanning. Therefore, it would have been obvious to combine Yamashita with Orito.

Orito in view of Yamashita does not disclose expressly that said storage medium of said image sensing apparatus is adapted to hold data on an image sensing characteristic which is different from data for the shading correction; and that said image sensing characteristic correction unit of said image processing apparatus corrects the influence of an image sensing characteristic on the shading-corrected image data, and thus performs correction different than shading correction.

Sugiura discloses holding data on an image sensing characteristic (figure 1(102) and figure 4(405) of Sugiura) which is different from data for shading correction (column 2, lines 35-41 and column 4, lines 5-8 of Sugiura); and correcting the influence of an image sensing characteristic different than shading correction (column 2, lines 35-41 and column 4, lines 5-8 of Sugiura). Color conversion based

Art Unit: 2625

on the connected input device (column 2, lines 35-41 and column 4, lines 5-8 of Sugiura) is clearly a different image sensing characteristic than shading correction.

Orito in view of Yamashita is combinable with Sugiura because they are from the same field of endeavor, namely correction of input digital image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to have the storage medium taught by Orito hold data for an image sensing characteristic that is different from data for shading correction, as taught by Sugiura; and have the an image sensing characteristic correction unit taught by Orito correct the influence of said image sensing characteristic, as taught by Sugiura. The motivation for doing so would have been to correct for the various input devices so as to standardize the resultant output (column 1, lines 33-41 of Sugiura). Therefore, it would have been obvious to combine Sugiura with Orito in view of Yamashita to obtain the invention as specified in claims 1, 15 and 86.

Further regarding claim 15: The apparatus of claim 15 is fully embodied within the system of claim 1.

Further regarding claim 86: The apparatus of claim 86 is fully embodied within the system of claim 1.

Regarding claims 3 and 17: Orito does not disclose expressly that said image sensing characteristic includes a characteristic for each of a plurality of colors to be sensed.

Yamashita discloses an image sensing characteristic for each of a plurality of colors to be sensed (column 9, line 56 to column 10, line 6 of Yamashita).

Orito and Yamashita are combinable because they are from the same field of endeavor, namely the correction of scanned digital image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use an image sensing characteristic for each color, as taught by Yamashita. The motivation for doing so would have been to correct shading for each individual color (column 9, lines 63-66 of Yamashita). Therefore, it would have been obvious to combine Yamashita with Orito to obtain the invention as specified in claims 3 and 17.

Regarding claim 5: Orito discloses that the data on image sensing characteristic is output from said image sensing apparatus to said image processing apparatus upon starting up said image sensing apparatus (figure 6 and column 7, lines 36-38 of Orito).

Regarding claims 8 and 21: Orito discloses that when the data on image sensing characteristic held in said storage medium is updated (column 7, lines 40-44 and lines 58-60 of Orito), said output unit outputs the updated data on image sensing characteristic to said image processing apparatus (column 8, lines 16-18 of Orito).

Art Unit: 2625

Regarding claim 19: Orito discloses that the data on image sensing characteristic is output from said image sensing apparatus to the external image processing apparatus in an initial communication there between (column 7, lines 36-44 of Orito).

5. Claims 7, 9-14, 20 and 22-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orito (US Patent 6,072,912) in view of Yamashita (US Patent 5,701,505), Sugiura (US Patent 4,679,074), and Kamisuwa (US Patent 6,728,008 B1).

Regarding claims 7 and 20: Orito in view of Yamashita does not disclose expressly that said image sensing apparatus further comprises updating means for, when an exchangeable unit including said image sensor is exchanged, updating the data on image sensing characteristic held in said storage medium in accordance with a characteristic of the unit.

Sugiura discloses updating unit (figure 3(406) of Sugiura) adapted to, when an exchangeable unit including said image sensor is exchanged (column 4, lines 5-6 of Sugiura), update the data on image sensing characteristic held in said storage medium in accordance with a characteristic of the unit (column 4, lines 6-13 of Sugiura).

Orito in view of Yamashita is combinable with Sugiura because they are from the same field of endeavor, namely digital image data processing. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to include the updating unit taught by Sugiura. The motivation for doing so would have been to compensate for the different properties of the different input devices (column 4, lines 10-13 of Sugiura). Therefore, it would have been obvious to combine Sugiura with Orito in view of Yamashita to obtain the invention as specified in claims 7 and 20.

Further regarding claims 9 and 22: Kamisuwa discloses an optical element (figure 2(OP) of Kamisuwa) which brings about a change in spatial positional deviation amount of the plurality of colors of pixel signals obtained by the plurality of photoelectric conversion element arrays of said image sensor (column 6, lines 12-20 of Kamisuwa), and the data on image sensing characteristic includes basic data (a,b,c) which indicates a basic amount of the positional deviation amount (column 8, lines 6-10 of Kamisuwa), and auxiliary data (Ia,Ib,Ic) which indicates a change characteristic of the positional deviation amount (column 8, lines 11-16 of Kamisuwa).

Further regarding claims 10 and 23: Kamisuwa discloses that said optical element is controlled or adjusted in accordance with a magnification of an image sensed by said image sensor (column 6, lines 7-9 and lines 12-15 of Kamisuwa).

Further regarding claims 11 and 24: Kamisuwa discloses that the data on image sensing characteristic includes data which indicates a relationship between actual positions at which light forms images on the plurality of photoelectric conversion element arrays, and design positions thereof (column 8, lines 6-10 of Kamisuwa).

Further regarding claims 12 and 25: Kamisuwa discloses that said image sensing apparatus further comprises an optical system (figure 2(OP) of Kamisuwa) for forming an original image on an imaging surface of said image sensor (column 4, lines 8-15 of Kamisuwa), and said image sensor senses the original image (column 4, lines 16-21 of Kamisuwa).

Regarding claims 13 and 26: Orito does not disclose expressly that said image sensor has the plurality of photoelectric conversion element arrays which are separated at a predetermined line spacing.

Yamashita disclose that said image sensor has the plurality of photoelectric conversion element arrays which are separated at a predetermined line spacing (figure 7(ΔX) and column 7, lines 51-54 of Yamashita).

Orito and Yamashita are combinable because they are from the same field of endeavor, namely the correction of scanned digital image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use an image sensor in which the plurality of photoelectric conversion element arrays are separated at a predetermined line spacing, as taught by Yamashita. The motivation for doing so would have been to provide a consistent reading of the document image (column 7, lines 48-58 of Yamashita). Therefore, it would have been obvious to combine Yamashita with Orito to obtain the invention as specified in claims 13 and 26.

Further regarding claims 14 and 27: Kamisuwa discloses that the plurality of colors are three colors including red (R), green (G), and blue (B) (column 9, lines 17-21 of Kamisuwa), and the data on image sensing characteristic includes data indicating spatial deviation amounts among R, G, and B pixel signals (column 8, lines 11-15 of Kamisuwa).

6. Claims 2, 6 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Orito (US Patent 6,072,912) in view of Yamashita (US Patent 5,701,505), Sugiura (US Patent 4,679,074), and Ohta (US Patent 5,875,260).

Regarding claims 2 and 16: Orito in view of Yamashita and Sugiura does not disclose expressly that the image sensing characteristic is a linearity characteristic.

Ohta discloses an image sensing characteristic ($L^*a^*b^*$ space) that is a linearity characteristic (column 4, lines 4-7 of Ohta).

Art Unit: 2625

Orito in view of Yamashita and Sugiura is combinable with Ohta because they are from the same field of endeavor, namely the correction of digital image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to use a linearity characteristic, such as the $L^*a^*b^*$ space taught by Ohta, as the image sensing characteristic. The motivation for doing so would have been that $L^*a^*b^*$ space is a standardized color space that has been provided by the CIE (column 4, lines 4-5 of Ohta). Therefore, it would have been obvious to combine Ohta with Orito in view of Yamashita and Sugiura to obtain the invention as specified in claims 2 and 16.

Regarding claim 6: Orito in view of Yamashita and Sugiura does not disclose expressly that said generation unit generates the image sensing characteristic correction data by inversely converting the data on image sensing characteristic.

Ohta discloses generating image sensing characteristic correction data (R', G', B') by inversely converting the data on image sensing characteristic (column 5, lines 60-64 of Ohta).

Orito in view of Yamashita and Sugiura is combinable with Ohta because they are from the same field of endeavor, namely the correction of digital image data. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to inversely convert the data on image sensing characteristic, as taught by Ohta. The motivation for doing so would have been to obtain the image signals resulting from the image data correction in the original color space (RGB) (column 5, lines 61-63 of Ohta). Therefore, it would have been obvious to combine Ohta with Orito in view of Yamashita and Sugiura to obtain the invention as specified in claim 6.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to James A. Thompson whose telephone number is 571-272-7441. The examiner can normally be reached on 8:30AM-5:00PM.

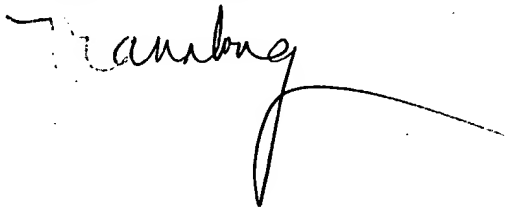

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David K. Moore can be reached on 571-272-7437. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
